

Hardware Plans

Group 20 – eBin

We plan on using the current hardware model (snapshot below) that we had planned for Rev1 to be the same model that is to be used in the final demo.

The only difference between the Rev1 model (above) and the final model that was originally planned is that we originally planned to replace the cardboard box with a 3D-printed box. Due to the current situation it will be very hard for us to find a place to complete the 3D printing, both within McMaster as well as outside. Apart from this, all the internal hardware, including the flipping plate, camera, and Raspberry Pi are all on track to be configured the same way as we originally planned. The material of the box will be the only change for us.
